Art Unit: 2874

DETAILED ACTION

Response to Amendment

Applicant's Amendment filed August 22, 2003 has been fully considered and entered.

Claim Rejections - 35 USC § 103

The indicated allowability of claims 8-10 is withdrawn in view of the newly discovered reference(s) to Poladain et al. (WO 99/67664). Rejections based on the newly cited reference(s) follow.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 2, 4, 5 and 7-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Poladian et al. (WO 99/67664).

Regarding claims 1, 4, 8, 15, 17 and 18; Poladian et al. discloses a method of reducing systematic errors (see page 3, lines 17-30) in grating writing in an optical waveguide (see the abstract and Figure 1), the method comprising the steps of:

controlling the interferometric arrangement of the writing apparatus and the residence time of the writing beam on the fiber to achieve desired spectral characteristics (the Bragg wavelength and the strength of the grating, see page 3, lines 6-16);

Art Unit: 2874

- writing a complete test grating (initial portion of the grating structure)
 experimentally in a first portion of a first waveguide according to the
 theoretical test grating structure design using a grating writing
 arrangement (see the abstract and Figure 1);
- measuring the actual spectral characteristics (spectral reflectance response) of the complete test grating structure (initial portion of the grating structure);
- reconstructing an actual design of the complete test grating structure
 from the actual spectral characteristics (utilizing the parameters to alter
 the characteristics of a subsequently written portion of the grating
 structure to provide for an improved form of the grating structure,
 where the improved form is also tested/measured, see the abstract);
 and
- writing a compensated grating structure using the same grating writing arrangement in a different portion of the first waveguide using a compensated design based on a comparison of the initial design with the actual design of the complete test grating;
- wherein the compensated grating structure is based on a different theoretical grating structure (the compensated design) than the theoretical test grating structure;
- wherein the step of measuring (testing) the actual spectral characteristics may comprise measuring the actual spectral

Art Unit: 2874

characteristics of the complete test grating (initial portion of the grating structure) from both ends thereof (see page 4, lines 23-26); and

 wherein a processing means (analyzer, 16, and computer, 17) are arranged and used to control the writing of the grating structure based on a theoretical grating design and compensation data obtained from the arrangement to compensate for systematic errors.

Poladian et al. does not specifically state that the initial interferometric arrangement for writing the initial portion of the grating structure is numerically designed, however, the initial interferometric arrangement must inherently be numerically determined for a desired wavelength, based on the well known relationship between the desired Bragg wavelength and the period of the grating to be written, thereby calculating an interferometric arrangement for achieving the necessary period for the grating. Therefore, one of ordinary skill in the art would have found it obvious to numerically design the initial portion of the grating structure by calculating the necessary grating period for the desired Bragg wavelength and the initial interferometric arrangement to achieve the calculated period.

Regarding claims 2, 5, 7, 9 and 10; Poladian et al. teaches all of the limitations of claims 2, 5, 7, 9 and 10 as applied above, except for specifically stating that an inverse scattering problem based on the measured actual spectral characteristics is solved; that the comparison of the actual with the initial numerical design comprises subtracting deviations of the actual from the numerical design from the numerical design to form the compensated design; that the comparison of the actual with the initial numerical design

Art Unit: 2874

comprises multiplying the theoretical test grating function with a ratio of the theoretical test grating function and the actual test grating function; that different weighting factors are used for the different end reconstructions of the complete test grating to form the reconstructed actual design; and that a half-sum of different reconstructions of the complete test grating are used to reconstruct the actual design. Standard mathematical methods for analyzing theoretical values with respect to experimental values to determine a corrected or compensated value include inverse problem solving based on the measured/experimental values in relation to the theoretical values, subtracting measured deviations/differences between measured/experimental and theoretical values from theoretical values, multiplying theoretical values/functions with a ratio of the theoretical values/functions to the measured/experimental values/functions, applying different weighting factors to two measured values, and using a half-sum method to analyze multiple measured values.

One of ordinary skill in the art would have been familiar with standard methods of mathematical analysis for comparing theoretical values/functions to experimental/measured values/functions. Therefore, one of ordinary skill in the art would have found it obvious to solve an inverse scattering problem based on the measured actual spectral characteristics; subtract deviations of the actual from the numerical design from the numerical design; multiply the theoretical test grating function with a ratio of the theoretical test grating function to the actual test grating function; apply different weighting factors to the two measured values from each end of the grating; or use a half-sum method to analyze the two measured values from each end of

Art Unit: 2874

the grating to determine a corrected/compensated value and write a compensated grating structure in the invention of Poladian et al., since these are standard methods for mathematical analysis and Poladian et al. does not teach that a specific mathematical technique must be employed to analyze the measured values for the test grating (initial portion of the grating structure).

Regarding claim 11; the steps are repeated (iterated), wherein the compensated design structures takes on the role of the complete test grating structure (initial portion of the grating structure, see the abstract).

Regarding claim 12; Poladian et al. teaches that the steps are repeated (iterated, see the abstract) to write the complete grating structure and that illumination is terminated when a desired value (desired accuracy) is reached (see page 6, lines 1-6).

Regarding claims 13 and 14; the steps of writing the complete test grating (initial portion of the grating structure) and the compensated grating comprise utilizing an interferometer for inducing refractive index changes in a waveguide (fiber, 11) to form the test and compensated grating structures (see the abstract and Figure 1).

Regarding claim 16; On page 4, line 18, through page 6, line 6, Poladain et al. teaches that the analyzer (16) and computer system (17) are used to measure and analyze the spectral information from the test grating structure and that a predicted response can be readily estimated from the knowledge of the previously written values (i.e. most recently measured values) so that a predictor-corrector algorithm can be run in real time. In order for the predictor-corrector algorithm to be run a real time, the

Art Unit: 2874

analyzer and/or computer system is required to store the measured compensation data from at least the most recent measurements of a particular grating arrangement.

Regarding claims 19, 20 and 21; Figure 1 discloses a waveguide structure (11) incorporating a grating written by the method taught by Poladain et al.

Allowable Subject Matter

Claims 3 and 6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: Claims 3 and 6 are allowable over the prior art of record for the reasons stated in the Office action mailed April 23, 2003.

Response to Arguments

Applicant's arguments with respect to claims 1-21 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to

Art Unit: 2874

consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Any inquiry concerning the merits of this communication should be directed to Examiner Michelle R. Connelly-Cushwa at telephone number (703) 305-5327. The examiner can normally be reached 9:00 AM to 7:00 PM, Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rodney B. Bovernick can be reached on 703-308-4819. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Any inquiry of a general or clerical nature should be directed to the Technology Center 2800 receptionist at telephone number (703) 308-0956.
